

Focus Area 16: Maternal, Infant, and Child Health

Objective 16-10a targets a reduction in low birth weight births (LBW, less than 2,500 grams) to a rate of 5.0 per 100 live births (5.0 percent).

A total of 32,853 LBW births were reported in 2000, at a rate of 6.2 percent of all live births based on data extracted from the Birth Statistical Master Files (Figure 16-10a, Table 16-10a). A total of 33,196 were reported at a rate of 6.3 percent in 2001, 33,859 in 2002 at a rate of 6.4 percent, 35,659 in 2003 at a rate of 6.6 percent, and 36,481 in 2004 at a rate of 6.7 percent. California's LBW birth rates are significantly higher than the HP2010 objective, and the trend in rates is significantly increasing away from the target of 5.0 percent.

Data by race-ethnicity show that the highest LBW birth rates were found for African Americans/Blacks (11.8 percent in 2000, 11.9 in 2001, 11.7 in 2002, 12.6 in 2003 and in 2004). The Asian population experienced the next highest LBW rates in three of the five years examined (7.4 percent in 2004), followed by the Multirace population (6.9 percent in 2004). This HP2010 objective is not being achieved for any racial or ethnic group, and trends in LBW rates are significantly increasing away from the target for both White and for Hispanic/Latino births.

Examined by age of the mother, LBW birth rates were highest for those under 15 years (11.6 percent in 2004), followed by those aged 35 years and over (8.5 percent in 2004). The HP2010 objective of 5.0 percent was not being achieved for any maternal age group as of 2004.

Low birth weight rates were significantly higher for female infants than male infants across the time period 2000-2004. Trends in LBW rates for both female and male births are significantly increasing away from the HP2010 target.

For more information on low birth weight (LBW) in California, visit the Maternal and Child Health Branch Web site at:
